

Proposal for Predicting User Retention

Problem Statement:

User retention is a critical metric for businesses offering digital products and services. Understanding the factors that influence whether a user will continue using a service or churn is essential for improving customer experience and optimizing marketing strategies. However, predicting user retention can be challenging due to the complex interactions of user behaviors and preferences over time.

Objective:

To develop a predictive model that analyzes user behavior data to determine whether a user is likely to continue using a service. The project will leverage historical usage data and machine learning techniques to identify key factors affecting user retention.

Expected Outcomes:

1. A machine learning model capable of accurately predicting user retention based on historical usage data.
2. Insights into the key factors influencing user retention and churn.
3. A report or dashboard visualizing predictions and user behavior trends.
4. Recommendations for improving user retention strategies based on the findings.
